

Recombinant antigen p30 (SAG1) for *Toxoplasma gondii*

CATALOG NUMBER: RAG0019

LOT NUMBER: #

RECOMBINANT ANTIGEN: *T. gondii* antigen p30 (Santoro et al., 1986).

DESCRIPTION: an antigenic fragment of the *T. gondii* antigen p30 has been prepared as a recombinant antigen fused to a his-tag in its C-terminal. It corresponds to the *T. gondii* major surface antigen (SAG1).

PRESENTATION: liquid protein solution

SOURCE: *Pichia pastoris*

MOLECULAR WEIGHT: SDS-PAGE analysis determines that the protein band is between the molecular markers of 18,400 Da and 25,000 Da due to the glycosylation pattern, while relative molecular mass, calculated from amino acid sequence and without glycosylation, is 16,886.04 Da.

BATCH COMPOSITION:

COMPONENTS	COMPOSITION
his-p30	recombinant antigen with a his-tag in its C-terminus
Storage buffer	20 mM phosphate buffer pH 8, 0.1 M KCl and 0.1% polyoxyethylene (10) tridecyl ether

QUALITY CONTROL:

1. PROTEIN CONCENTRATION DETERMINED ESPECTROPHOTOMETRICALLY

DO₂₈₀ = 1.34
 A_{0.1%} (=1 g/l) = 0.850
 CONCENTRATION*: 1.57 mg/ml

* The measurement of the protein concentration has been performed with the theoretical extinction coefficient of the recombinant protein obtained from Gill and vonHippel, 1989. It is recommended that the users carry out their absorbance determinations to avoid equipment variabilities regarding final concentration, mainly in reproducibility analysis.

2. PURITY CONTROL IN SDS-PAGE: 15%

kDa Mw p30 (SAG1)

Figure 1. SDS-PAGE analysis (15%) of 10 µl of recombinant p30. Purity is > 95% as determined by gel electrophoresis. The signal which appears between markers of 52,000 and 34,000 Da corresponds to the homodimer of the protein, which is described in bibliography. The signal under de marker of 26,000 Da corresponds to the monomer.

3. TITRATION CURVE BY AN ELISA ASSAY

The titer has been suggested in reference to an "in-house" ELISA kit performed at Rekom Biotech over the first lot obtained.

Each end user should carry out his own titration for his particular application.

Figure 2. In this plot, the optical density at 450/620 nm for positive (blue) and negative (gray) IgM sera for toxoplasmosis are compared for each concentration of the recombinant antigen. An appropriate statistical test of significance for the comparison of means between both groups, the Welch's test, is employed. Eligible concentrations for the use of the antigen should present statistically significant differences between positive and negative sera. This happens when the intervals at the top do not overlap and, equivalently, when the p-value at the bottom is below 0.05. In the present figure, all p-values are below 0.05 and thus the intervals do not overlap. Therefore, any of the showed concentrations can be used to distinguish between positive and negative sera.

4. ABSENCE OF PRECIPITATION AFTER A FREEZING AND THAWING CYCLE: ok

LOT SPECIFICATIONS:

- 1. CONCENTRATION:** 1.57 mg/ml
- 2. TOTAL QUANTITY PER ALIQUOT:** 1 mg
- 3. TOTAL VOLUME PER ALIQUOT:** 0.668 ml
- 4. SUGGESTED TITER BY ELISA:** up to 1:3,140, which corresponds to 0.5 µg/ml of protein concentration in plates for IgG and IgM detection. Better P/N ratios in IgG detection are obtained at protein concentrations of 0.05 µg/ml.
- 5. STORAGE:** Protein is shipped with dry ice. Upon arrival, it should be aliquoted to avoid repeated freezing and thawing cycles and stored at -20°C to -80°C. In order to defrost the protein, maintain the aliquot at 25°C without shaking to avoid aggregation.
- 6. TESTED APPLICATIONS:** ELISA.
- 7. POSSIBLE APPLICATIONS:** WB, DB, Indirect ELISA, positive control in direct ELISA, CLIA, lateral-flow. Where this product has not been tested for use in a particular technique,

this does not necessarily exclude its use in such procedures. Suggested working dilutions are given as a guide only. It is recommended that the user titrates. **Due to the nonspecific interaction with anti-CCDs present in normal human or animal sera, we strongly recommend using 12.5 µg of our sorbent SOR0001 on the analyzed sera in any immunoassay.**

8. OBSERVATIONS: proteins should be maintained frozen at high concentrations. The dilution to be performed for ELISA assays should be made with a small quantity of protein, the same day of the experiment. In order to defrost the protein, maintain the aliquot at 25°C without shaking to avoid aggregation. Prior making test dilutions and after defrosting the protein, is recommended to remove possible protein aggregates by centrifuging the stock solution, avoiding alterations in the immobilization of the biomolecule to the solid surface.

Important Notes: During shipment, small volumes of product will occasionally become entrapped in the seal of the product vial. For products with volumes of 200 µl or less, we recommend gently tapping the vial on a hard surface or briefly centrifuging the vial in a tabletop centrifuge to dislodge any liquid in the containers cap.

Although recombinant antigens are expressed in non-pathogenic *P. pastoris* and bacterial integrity is destroyed during purification, the antigen preparation should be handled as potentially infectious.

FOR RESEARCH AND COMMERCIAL USE *IN VITRO*: not for human *in vivo* or therapeutic use.
